The zeros correspond to the maxima and minima of the difference of potential:  $wt = kn - n$  (14) These maxima and minima occur at times given by the formula  $-(2M-l)-P-\$$ . (15) Efficiency of the Charging Circuit. Let us suppose that the spark passes at the time when the potential difference at the condenser terminals is  $v$ . The energy available for the circuit at the condenser terminals is  $CV$ . The energy expended in the  $m$  charging circuit is  $I$  Edt. The efficiency is the ratio of these two quantities: (16) In the case of aperiodic charging, the potential difference at the condenser terminals is always less than the electromotive force and the efficiency less than 0.5. Because of this low value of the efficiency, such a condition should be avoided in practice. In the case of periodic charging, the potential difference is a damped period function, oscillating above and below the electromotive force  $E$ . Its maxima are given by  $wt = (2k + l)x - i$ ., (17) which maxima become smaller as  $k$  increases. (See...
